### Outline

- Weak/Galerkin formulation

## Target problem

Weak/Galerkin formulation

Consider the 2D second order elliptic equation

$$-\nabla \cdot (c\nabla u) = f$$
, in  $\Omega$   
 $u = g$ , on  $\partial \Omega$ .

Dirichlet boundary condition

where  $\Omega$  is a 2D domain, f(x, y) and c(x, y) are given functions on  $\Omega$ , g(x, y) is a given function on  $\partial \Omega$  and u(x, y)is the unknown function.

• The gradient of a 2D function u is defined by

$$\nabla u=(u_x,u_y).$$

• The divergence of a  $2 \times 1$  vector  $\overrightarrow{v}$  is defined by

$$\nabla \cdot \overrightarrow{v} = \frac{\partial v_1}{\partial x} + \frac{\partial v_2}{\partial y}.$$

### Weak formulation

• First, multiply a function v(x, y) on both sides of the original equation,

$$\begin{aligned}
-\nabla \cdot (c\nabla u) &= f & \text{in } \Omega \\
\Rightarrow &-\nabla \cdot (c\nabla u)v &= fv & \text{in } \Omega \\
\Rightarrow &-\int_{\Omega} \nabla \cdot (c\nabla u)v \, dxdy &= \int_{\Omega} fv \, dxdy.
\end{aligned}$$

Dirichlet boundary condition

• u(x, y) is called a trail function and v(x, y) is called a test function.

#### Weak formulation

 Second, using Green's formula (divergence theory, integration) by parts in multi-dimension)

$$\int_{\Omega} \nabla \cdot (c \nabla u) v \ dxdy = \int_{\partial \Omega} (c \nabla u \cdot \vec{n}) v \ ds - \int_{\Omega} c \nabla u \cdot \nabla v \ dxdy,$$

we obtain

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy - \int_{\partial \Omega} (c \nabla u \cdot \vec{n}) \, v \, ds = \int_{\Omega} f v \, dx dy.$$

Weak/Galerkin formulation

- Since the solution on the domain boundary  $\partial\Omega$  are given by u(x,y)=g(x,y), then we can choose the test function v(x,y) such that v=0 on  $\partial\Omega$ .
- Hence

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy = \int_{\Omega} f v \, dx dy.$$

• What spaces should u and v belong to? Sobolev spaces!

#### Definition (Support)

If u is a function defined on a domain  $\Omega$ , then its support supp(u) is the closure of the set on which u is nonzero.

#### Definition (Compactly supported)

If u is a function defined on a domain  $\Omega$  and supp(u) is a compact subset (that is, a closed and bounded subset), then u is said to be compactly supported in  $\Omega$ .

#### Lemma (I)

A function compactly supported in  $\Omega$  is zero on and near the boundary of  $\Omega$ .

Weak/Galerkin formulation

#### Definition

 $C_0^{\infty}(\Omega)$  is the set of all functions that are infinitely differentiable on  $\Omega$  and compactly supported in  $\Omega$ .

Recall integration by parts:

$$\int_{\Omega} \frac{\partial u}{\partial x} v \ dxdy = \int_{\partial \Omega} uvn_x \ ds - \int_{\Omega} u \frac{\partial v}{\partial x} \ dxdy.$$

• For  $v \in C_0^{\infty}(\Omega)$ , we have v = 0 on  $\partial \Omega$ . Then

$$\int_{\Omega} \frac{\partial u}{\partial x} v \ dxdy = -\int_{\Omega} u \frac{\partial v}{\partial x} \ dxdy.$$

#### Definition (weak derivative with respect to x in 2D)

Suppose u is a real-valued function defined on a domain  $\Omega$  and that u is integrable over every compact subset of  $\Omega$ . If there exists another locally integrable function w defined on  $\Omega$  such that

Dirichlet boundary condition

$$\int_{\Omega} wv \ dxdy = -\int_{\Omega} u \frac{\partial v}{\partial x} \ dxdy.$$

for all  $v \in C_0^{\infty}(\Omega)$ , then u is said to be weakly differentiable with respect to x and w is called the weak partial derivative of u with respect to x.

Weak/Galerkin formulation

#### Definition (general weak derivative in 2D)

Let  $\alpha = (\alpha_1, \alpha_2)$ . Suppose u is a real-valued function defined on a domain  $\Omega$  and that u is integrable over every compact subset of  $\Omega$ . If there exists another locally integrable function w defined on  $\Omega$ such that

Dirichlet boundary condition

$$\int_{\Omega} wv \ dxdy = (-1)^{\alpha_1 + \alpha_2} \int_{\Omega} u \frac{\partial^{\alpha_1 + \alpha_2} v}{\partial x^{\alpha_1} \partial y^{\alpha_2}} \ dxdy.$$

for all  $v \in C_0^{\infty}(\Omega)$ , then u is said to be  $\alpha$  weakly differentiable and w is called the weak partial derivative of order  $\alpha$  of u.

Weak/Galerkin formulation

#### Lemma (II)

If u is differentiable, then u is weakly differentiable and its weak derivative of order  $\alpha=(\alpha_1,\alpha_2)$  is  $\frac{\check{\delta}^{\alpha_1+\alpha_2}u}{\partial x^{\alpha_1}\partial v^{\alpha_2}}$ .

Dirichlet boundary condition

#### Remark

In the Sobolev spaces, which will be defined below,  $\frac{\partial^{\alpha_1+\alpha_2}u}{\partial x^{\alpha_1}\partial y^{\alpha_2}}$  is used to represent the weak derivative of order  $\alpha = (\alpha_1, \alpha_2)$ .

### Definition ( $L^p$ space)

$$L^p(\Omega) = \{ v : \Omega \to \mathbf{R} : \int_{\Omega} v^p \ dx dy < \infty \}.$$

### Definition ( $L^2$ space)

$$L^2(\Omega) = \{ v : \Omega \to \mathbf{R} : \int_{\Omega} v^2 \, dx dy < \infty \}.$$

### Definition ( $L^{\infty}$ space)

$$L^{\infty}(\Omega) = \{v : \Omega \to \mathbf{R} : \sup_{(x,y) \in \Omega} |u(x,y)| < \infty\}.$$

More Discussion

### Sobolev spaces

### Definition ( $H^m$ space)

$$H^{m}(\Omega) = \{ v \in L^{2}(\Omega) : \frac{\partial^{\alpha_{1}+\alpha_{2}}v}{\partial x^{\alpha_{1}}\partial y^{\alpha_{2}}} \in L^{2}(\Omega), \ \forall \alpha_{1}+\alpha_{2}=1,\cdots,m \}.$$

Dirichlet boundary condition

### Definition ( $H^1$ space)

$$H^{1}(\Omega) = \{ v \in L^{2}(\Omega) : \frac{\partial^{\alpha_{1} + \alpha_{2}} v}{\partial x^{\alpha_{1}} \partial v^{\alpha_{2}}} \in L^{2}(\Omega), \ \forall \alpha_{1} + \alpha_{2} = 1 \}.$$

### Definition $(H_0^1 \text{ space})$

$$H_0^1(\Omega) = \{ v \in H^1(\Omega) : v = 0 \text{ on } \partial\Omega \}.$$

### Definition ( $W_p^m$ space)

$$W_p^m(\Omega) = \{ v : \Omega \to \mathbf{R} : \int_{\Omega} \left[ \frac{\partial^{\alpha_1 + \alpha_2} v}{\partial x^{\alpha_1} \partial y^{\alpha_2}} \right]^p dx dy < \infty,$$
$$\forall \alpha_1 + \alpha_2 = 0, \cdots, m \}.$$

#### Remark

- $L^p(\Omega) = W_p^0(\Omega)$ ;
- $L^{2}(\Omega) = W_{2}^{0}(\Omega);$
- $H^m(\Omega) = W_2^m(\Omega)$ ;
- $H^1(\Omega) = W_2^1(\Omega)$ .

• Weak formulation: find  $u \in H^1(\Omega)$  such that

$$\int_{\Omega} c \nabla u \cdot \nabla v \ dx dy = \int_{\Omega} f v \ dx dy.$$

Dirichlet boundary condition

for any  $v \in H_0^1(\Omega)$ .

- Let  $a(u, v) = \int_{\Omega} c \nabla u \cdot \nabla v dx dy$  and  $(f, v) = \int_{\Omega} f v dx dy$ .
- Weak formulation: find  $u \in H^1(\Omega)$  such that

$$a(u,v)=(f,v)$$

for any  $v \in H_0^1(\Omega)$ .

### Galerkin formulation

Weak/Galerkin formulation

- Assume there is a finite dimensional subspace  $U_h \subset H^1(\Omega)$ .
- Then the Galerkin formulation is to find  $u_h \in U_h$  such that

$$a(u_h, v_h) = (f, v_h)$$

$$\Leftrightarrow \int_{\Omega} c \nabla u_h \cdot \nabla v_h \, dx dy = \int_{\Omega} f v_h \, dx dy$$

for any  $v_h \in U_h$ .

- Basic idea of Galerkin formulation: use finite dimensional space to approximate infinite dimensional space.
- ullet Here  $U_h=span\{\phi_j\}_{j=1}^{N_b}$  is chosen to be a finite element space where  $\{\phi_i\}_{i=1}^{N_b}$  are the global finite element basis functions.

FE Method

- Weak/Galerkin formulation
- 2 FE discretization
- Oirichlet boundary condition
- 4 FE Method
- More Discussion

#### Discretization formulation

#### Recall the following definitions from Chapter 2:

- N: number of mesh elements.
- $N_m$ : number of mesh nodes.
- $E_n$  ( $n=1,\cdots,N$ ): mesh elements.
- $Z_k$  ( $k = 1, \dots, N_m$ ): mesh nodes.
- $\bullet$   $N_I$ : number of local mesh nodes in a mesh element.
- P:information matrix consisting of the coordinates of all mesh nodes.

Dirichlet boundary condition

• T: information matrix consisting of the global node indices of the mesh nodes of all the mesh elements.

Weak/Galerkin formulation

### Discretization formulation

- We only consider the nodal basis functions (Lagrange type) in this course.
- $N_{lb}$ : number of local finite element nodes (=number of local finite element basis functions) in a mesh element.
- $N_b$ : number of the finite element nodes (= the number of unknowns = the total number of the finite element basis functions).
- $X_i$   $(j = 1, \dots, N_b)$ : finite element nodes.
- P<sub>b</sub>: information matrix consisting of the coordinates of all finite element nodes.
- T<sub>h</sub>: information matrix consisting of the global node indices of the finite element nodes of all the mesh elements.

• Recall the Galerkin formulation: find  $u_h \in U_h$  such that

$$a(u_h, v_h) = (f, v_h)$$

$$\Leftrightarrow \int_{\Omega} c \nabla u_h \cdot \nabla v_h \, dx dy = \int_{\Omega} f v_h \, dx dy$$

for any  $v_h \in U_h$ .

- Here  $U_h = span\{\phi_j\}_{j=1}^{N_b}$  is chosen to be a finite element space where  $\{\phi_j\}_{j=1}^{N_b}$  are the global finite element basis functions defined in Chapter 2.
- Since  $u_h \in U_h = span\{\phi_i\}_{i=1}^{N_b}$ , then

$$u_h = \sum_{j=1}^{N_b} u_j \phi_j$$

for some coefficients  $u_j$   $(j=1,\cdots,N_b)$ .

#### Discretization formulation

In fact, since

$$\phi_j(X_k) = \delta_{jk} = \begin{cases} 0, & \text{if } j \neq k, \\ 1, & \text{if } j = k. \end{cases}$$

then

Weak/Galerkin formulation

$$u_h(X_k) = \sum_{j=1}^{N_b} u_j \phi_j(A_k) = u_k.$$

Dirichlet boundary condition

ullet Hence the coefficient  $u_i$  is actually the numerical solution at the node  $X_i$   $(j = 1, \dots, N_b)$ .

### Discretization formulation

- If we can set up a linear algebraic system for  $u_j$   $(j = 1, \dots, N_b)$  and solve it, then we can obtain the finite element solution  $u_h$ .
- Therefore, we choose the test function  $v_h = \phi_i \ (i=1,\cdots,N_b)$ . Then the finite element formulation gives

$$\int_{\Omega} c \nabla \left( \sum_{j=1}^{N_b} u_j \phi_j \right) \cdot \nabla \phi_i \, dx dy = \int_{\Omega} f \phi_i \, dx dy,$$

$$\Rightarrow \sum_{i=1}^{N_b} u_j \left[ \int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \, dx dy \right] = \int_{\Omega} f \phi_i \, dx dy, \quad i = 1, \dots, N_b.$$

### Matrix formulation

Weak/Galerkin formulation

Define the stiffness matrix

$$A = [a_{ij}]_{i,j=1}^{N_b} = \left[ \int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \, dx dy \right]_{i,j=1}^{N_b}.$$

Dirichlet boundary condition

Define the load vector

$$\vec{b} = [b_i]_{i=1}^{N_b} = \left[\int_{\Omega} f \phi_i \, dx dy\right]_{i=1}^{N_b}.$$

Define the unknown vector

$$\vec{X} = [u_j]_{j=1}^{N_b}.$$

Then we obtain the linear algebraic system

$$A\vec{X} = \vec{b}$$
.

Weak/Galerkin formulation

• Once  $\vec{X}$  is obtained, the finite element solution  $u_h$  and the numerical solutions at all the mesh nodes are obtained.

Dirichlet boundary condition

- From the definition of  $\phi_i$   $(j=1,\cdots,N_b)$ , we can see that  $\phi_i$ are non-zero only on the elements adjacent to the node  $X_i$ , but 0 on all the other elements.
- This observation motivates us to think about

$$a_{ij} = \int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \, dx dy = \sum_{n=1}^{N} \int_{E_n} c \nabla \phi_j \cdot \nabla \phi_i \, dx dy.$$

- It is easy to see that most of  $\int_{E_n} c \nabla \phi_j \cdot \nabla \phi_i \ dxdy$  will be 0.
- So we only need to use numerical integration to compute those nonzero integrals.

#### General local assembly idea for A:

- Loop over all the elements;
- Compute all non-zero local integrals on each element for A;
- Assemble these non-zero local integrals into the corresponding entries of the stiffness matrix A.

Compute all non-zero local integrals on each element for A:

- On the  $n^{th}$  element  $E_n$ , we get non-zero local integrals only when the trial and test basis functions are corresponding to the finite element nodes of this element.
- Let  $p_s = T_h(s, n)$   $(s = 1, \dots, N_{lh})$ .
- Then we only consider the trial and test basis functions to be  $\phi_{P_s}$   $(s=1,\cdots,N_{lb})$ .
- There are only  $N_{lh}^2$  non-zero local integrals on  $E_n$  with the global basis functions  $\phi_{D_s}$   $(s=1,\cdots,N_{lb})$ :

$$\int_{E_n} c \nabla \phi_j \cdot \nabla \phi_i \, dxdy \, (i,j=p_1,\cdots,p_{N_{lb}}).$$

In fact, we have

$$\psi_{ns} = \phi_{p_s}|_{E_n} \ (s=1,\cdots,N_{lb}).$$

Weak/Galerkin formulation

• That is, instead of the original non-zero local integrals with the global basis functions  $\phi_{p_s}$   $(s=1,\cdots,N_{lb})$ , we will compute the following non-zero local integrals with the local basis functions  $\psi_{ns}$   $(s=1,\cdots,N_{lb})$ :

Dirichlet boundary condition

$$\int_{E_n} c \nabla \psi_{n\alpha} \cdot \nabla \psi_{n\beta} \, dxdy \, (\alpha, \beta = 1, \cdots, N_{lb}).$$

- Question: how to compute these integrals?
- Gauss quadrature. The needed information is stored in the matrices P and T.

#### Assemble the non-zero local integrals into A:

- When the trial function is  $\phi_i$  and the test function is  $\phi_j$ , the corresponding non-zero local integrals should be assembled to  $a_{ij}$ .
- Therefore, if we find the global node indices of the trial and test basis functions, we can easily locate where to assemble a non-zero local integral.

Question: Since we compute

$$\int_{E_n} c \nabla \psi_{n\alpha} \cdot \nabla \psi_{n\beta} \, \, dxdy \, (\alpha,\beta = 1,\cdots,N_{lb})$$

Dirichlet boundary condition

instead of

$$\int_{E_n} c \nabla \phi_j \cdot \nabla \phi_i \, dxdy \, (i,j=p_1,\cdots,p_{N_{lb}}),$$

how do we obtain the corresponding global node indices of the local trial and test basis functions  $\psi_{n\alpha}$  and  $\psi_{n\beta}$   $(\alpha, \beta = 1, \cdots, N_{lb})$ ?

• Information matrix  $T_h!$ 

• Recall that  $T_b(\alpha, n)$  and  $T_b(\beta, n)$  give the global node indices of the local trial and test basis functions  $\psi_{n\alpha}$  and  $\psi_{n\beta} (\alpha, \beta = 1, \cdots, N_{lb}).$ 

Dirichlet boundary condition

• That is, for  $n = 1, \dots, N$ ,

$$\int_{E_n} c \nabla \psi_{n\alpha} \cdot \nabla \psi_{n\beta} \, dxdy \, (\alpha, \beta = 1, \cdots, N_{lb})$$

should be assembled to  $a_{ij}$  where  $i = T_b(\beta, n)$  and  $i = T_b(\alpha, n)$ 

#### Algorithm I-1:

- Initialize the matrix:  $A = sparse(N_b, N_b)$ ;
- Compute the integrals and assemble them into A:

```
FOR n=1,\cdots,N:

FOR \alpha=1,\cdots,N_{lb}:

FOR \beta=1,\cdots,N_{lb}:

Compute r=\int_{E_n}c\nabla\psi_{n\alpha}\cdot\nabla\psi_{n\beta}\;dxdy;

Add r to A(T_b(\beta,n),T_b(\alpha,n)).

END

END
```

FE Method

- Algorithm I-2:
  - Initialize the matrix:  $A = sparse(N_b, N_b)$  and  $S = zeros(N_{lb}, N_{lb})$ ;
  - Compute the integrals and assemble them into A:

```
FOR \ n=1,\cdots,N:
      FOR \alpha = 1, \dots, N_{lb}:
             FOR \beta = 1, \dots, N_{lb}:
                   Compute S(\beta, \alpha) = \int_{F_{-}} c \nabla \psi_{n\alpha} \cdot \nabla \psi_{n\beta} dxdy;
             END
      END
      A(T_b(:,n),T_b(:,n))=A(T_b(:,n),T_b(:,n))+S;
END
```

Weak/Galerkin formulation

## Assembly of the stiffness matrix

To make a general subroutine for different cases, more information needed for computing and assembling the integral should be treated as input parameters or input functions of this subroutine:

- the coefficient function c:
- the quadrature points and weights for numerical integrals;
- the mesh information matrices P and T, which can also provide the number of mesh elements N = size(T, 2) and the number of mesh nodes  $N_m = size(P, 2)$ ;
- the finite element information matrices  $P_h$  and  $T_h$  for the trial and test functions respectively, which can also provide the number of local basis functions  $N_{lb} = size(T_b, 1)$  and the number of the global basis functions  $N_b = size(P_b, 2)$  (= the number of unknowns);
- the type of the basis function for the trial and test functions respectively: 4 D > 4 A > 4 B > 4 B > B = 490

Note that

$$\int_{E_{n}} c \nabla \psi_{n\alpha} \cdot \nabla \psi_{n\beta} \ dx dy = \int_{E_{n}} c \frac{\partial \psi_{n\alpha}}{\partial x} \frac{\partial \psi_{n\beta}}{\partial x} \ dx dy + \int_{E_{n}} c \frac{\partial \psi_{n\alpha}}{\partial y} \frac{\partial \psi_{n\beta}}{\partial y} \ dx dy.$$

Dirichlet boundary condition

 Hence we can consider to develop an algorithm to assemble the matrix arising from a more general integral

$$\int_{F_n} c \frac{\partial^{r+s} \psi_{n\alpha}}{\partial x^r \partial y^s} \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} dxdy.$$

with parameters r, s, p, and q.

#### Algorithm I-3:

- Initialize the matrix:  $A = sparse(N_b, N_b)$ ;
- Compute the integrals and assemble them into A:

```
FOR \ n=1,\cdots,N:
         FOR \alpha = 1, \dots, N_{lb}:
                   FOR \beta = 1, \dots, N_{lb}:
                            Compute r = \int_{F_{-}} c \frac{\partial^{r+s} \psi_{n\alpha}}{\partial x^{r} \partial y^{s}} \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^{p} \partial y^{q}} dxdy;
                            Add r to A(T_b(\beta, n), T_b(\alpha, n)).
                   END
          END
END
```

### Assembly of the stiffness matrix

### Algorithm I-4:

- Initialize the matrix:  $A = sparse(N_b, N_b)$  and  $S = zeros(N_{lb}, N_{lb})$ ;
- Compute the integrals and assemble them into A:

```
FOR n = 1, \dots, N:
         FOR \alpha = 1, \dots, N_{lb}:
                  FOR \beta = 1, \dots, N_{lb}:
                          Compute S(\beta, \alpha) = \int_{E_{\alpha}} c \frac{\partial^{r+s} \psi_{n\alpha}}{\partial x^{r} \partial v^{s}} \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^{p} \partial v^{q}} dxdy;
                  END
         END
        A(T_b(:,n), T_b(:,n)) = A(T_b(:,n), T_b(:,n)) + S
END
```

Weak/Galerkin formulation

• First, we call Algorithm I-3 with r = p = 1 and s = q = 0 to obtain A1.

Dirichlet boundary condition

- Second, we call Algorithm I-3 with r = p = 0 and s = q = 1 to obtain A2.
- Then the stiffness matrix A = A1 + A2.
- That is, Algorithm I-1 is equivalent to calling Algorithm I-3 twice with two different groups of parameters (r=p=1, s=q=0 and r=p=0, s=q=1) and then adding the two resulted matrices together.
- Algorithm I-2 and Algorithm I-4 have a similar relationship.

 The idea for the assembly of the load vector is similar. We have

$$b_i = \int_{\Omega} f \phi_i \, dx dy = \sum_{n=1}^{N} \int_{E_n} f \phi_i \, dx dy, \ i = 1, \cdots, N_b.$$

Dirichlet boundary condition

- Loop over all the elements;
- Compute all non-zero local integrals on each element for the load vector  $\vec{b}$ :
- Assemble these non-zero local integrals into the corresponding entries of the load vector  $\vec{b}$ .

Compute all non-zero local integrals on each element for  $\hat{b}$ :

- On the  $n^{th}$  element  $E_n$ , we get non-zero local integrals only when the test basis functions are corresponding to the finite element nodes of the element.
- Let  $p_s = T_h(s, n)$   $(s = 1, \dots, N_{lh})$ .
- Then we only consider the test basis functions to be  $\phi_{P_s}$   $(s=1,\cdots,N_{lb})$ .
- There are only  $N_{lb}$  non-zero local integrals on  $E_n$  with the global basis functions  $\phi_{D_s}$   $(s=1,\cdots,N_{lb})$ :

$$\int_{E_0} f \phi_i \, dx dy \, (i = p_1, \cdots, p_{N_{lb}}).$$

In fact, we have

$$\psi_{ns} = \phi_{p_s}|_{E_n} \ (s=1,\cdots,N_{lb}).$$

Weak/Galerkin formulation

# • That is, instead of the original non-zero local integrals with the global basis functions $\phi_{p_s}$ ( $s=1,\cdots,N_{lb}$ ), we will compute the following non-zero local integrals with the local basis functions $\psi_{ps}$ ( $s=1,\cdots,N_{lb}$ ):

$$\int_{E_n} f \psi_{n\beta} \, dx dy \, (\beta = 1, \cdots, N_{lb}).$$

Dirichlet boundary condition

- Question: how to compute these integrals?
- Gauss quadrature. The needed information is stored in the matrices P and T.

Assemble the non-zero local integrals into  $\dot{b}$ :

- When the test function is  $\phi_i$ , the corresponding non-zero local integrals should be assembled to  $b_i$ .
- Therefore, if we find the global node indices of the test basis functions, we can easily locate where to assemble a non-zero local integral.
- Question: Since we compute

$$\int_{E_n} f \psi_{n\beta} \, dx dy \, (\beta = 1, \cdots, N_{lb})$$

instead of

$$\int_{E_n} f \phi_i \, dx dy \, (i = p_1, \cdots, p_{N_{lb}}),$$

how do we obtain the corresponding global node indices of the local test basis functions  $\psi_{n\beta}$  ( $\beta = 1, \dots, N_{lb}$ )?

Information matrix T<sub>b</sub>!

• Recall that  $T_b(\beta, n)$  give the global node indices of the local test basis functions  $\psi_{n\beta}$  ( $\beta = 1, \dots, N_{lb}$ ).

Dirichlet boundary condition

• That is, for  $n=1,\cdots,N$ ,

$$\int_{E_n} f \psi_{n\beta} \, dx dy \, (\beta = 1, \cdots, N_{lb})$$

should be assembled to  $b_i$  where  $i = T_b(\beta, n)$ .

### Algorithm II-1:

- Initialize the matrix:  $b = sparse(N_b, 1)$ ;
- Compute the integrals and assemble them into b:

```
FOR n=1,\cdots,N:

FOR \beta=1,\cdots,N_{lb}:

Compute r=\int_{E_n}f\psi_{n\beta}\;dxdy;

b(T_b(\beta,n),1)=b(T_b(\beta,n),1)+r;

END
```

More Discussion

### Algorithm II-2:

- Initialize the vector:  $b = sparse(N_b, 1)$  and  $d = zeros(N_{lb}, 1)$ ;
- Compute the integrals and assemble them into b:

```
FOR \ n = 1, \cdots, N:
       FOR \beta = 1, \cdots, N_{lb}:
               Compute d(\beta,1)=\int_{E_n}f\frac{\partial^{\rho+q}\psi_{n\beta}}{\partial x^\rho\partial v^q}\ dxdy;
       END
       b(T_b(:,n),1) = b(T_b(:,n),1) + d;
END
```

Weak/Galerkin formulation

To make a general subroutine for different cases, more information needed for computing and assembling the integral should be treated as input parameters or input functions of this subroutine:

- the right hand side function f;
- the quadrature points and weights for numerical integrals;
- the mesh information matrices P and T, which can also provide the number of mesh elements N = size(T, 2) and the number of mesh nodes  $N_m = size(P, 2)$ ;
- the finite element information matrices  $P_b$  and  $T_b$  for the test functions, which can also provide the number of local basis functions  $N_{lb} = size(T_b, 1)$  and the number of the global basis functions  $N_b = size(P_b, 2)$  (= the number of unknowns);
- the type of the basis function for the test functions.

More Discussion

• We can also consider to develop an algorithm to assemble the vector arising from

$$\int_{E_n} f \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} \ dx dy.$$

### Algorithm II-3:

- Initialize the matrix:  $b = sparse(N_b, 1)$ ;
- Compute the integrals and assemble them into b:

```
FOR n = 1, \dots, N:
       FOR \beta = 1, \cdots, N_{lb}:
               Compute r = \int_{E_n} f \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} dxdy;
               b(T_b(\beta, n), 1) = b(T_b(\beta, n), 1) + r
       END
END
```

### Algorithm II-4:

- Initialize the vector:  $b = sparse(N_b, 1)$  and  $d = zeros(N_{lb}, 1)$ ;
- Compute the integrals and assemble them into b:

```
FOR n=1,\cdots,N:

FOR \beta=1,\cdots,N_{lb}:

Compute d(\beta,1)=\int_{E_n}f\frac{\partial^{p+q}\psi_{n\beta}}{\partial x^p\partial y^q}\;dxdy;

END

b(T_b(:,n),1)=b(T_b(:,n),1)+d;
```

Weak/Galerkin formulation

# Assembly of the load vector

- We call Algorithm I-3 with p = q = 0 to obtain b.
- That is, Algorithm II-3 is equivalent to Algorithm II-1 with p = q = 0.

Dirichlet boundary condition

Algorithm II-2 and Algorithm II-4 have a similar relationship.

# Outline

- Weak/Galerkin formulation
- Oirichlet boundary condition

# Dirichlet boundary condition

- Basically, the Dirichlet boundary condition u = g give the solutions at all boundary finite element nodes.
- Since the coefficient  $u_i$  in the finite element solution  $u_h = \sum_{i=1}^{N_b} u_i \phi_i$  is actually the numerical solution at the finite element node  $X_i$   $(j = 1, \dots, N_b)$ , we actually know those  $u_i$ which are corresponding to the boundary finite element nodes.
- Recall that boundarynodes(2,:) store the global node indices of all boundary finite element nodes.
- If  $m \in boundarynodes(2, :)$ , then the  $m^{th}$  equation is called a boundary node equation.
- Set *nbn* to be the number of boundary nodes;

Weak/Galerkin formulation

• One way to impose the Dirichlet boundary condition is to replace the boundary node equations in the linear system by the following equations

$$u_m = g(X_m).$$

Dirichlet boundary condition

for all  $m \in boundary nodes(2, :)$ .

# Dirichlet boundary condition

### Algorithm III:

• Deal with the Dirichlet boundary conditions:

```
FOR \ k = 1, \cdots, nbn:
    If boundarynodes(1, k) shows Dirichlet condition, then
         i = boundary nodes(2, k);
         A(i,:) = 0:
         A(i,i)=1;
         b(i) = g(P_b(:,i));
    ENDIF
END
```

### Outline

- Weak/Galerkin formulation

- FE Method

### Universal framework of the finite element method

- Generate the mesh information: matrices P and T;
- Assemble the matrices and vectors: local assembly based on P and T only;
- Deal with the boundary conditions: boundary information matrix and local assembly;
- Solve linear systems: numerical linear algebra (Math 6601: Numerical Analysis).

- Generate the mesh information matrices P and T.
- Assemble the stiffness matrix A by using Algorithm I. (We will choose Algorithm I-3 in class)
- Assemble the load vector  $\vec{b}$  by using Algorithm II. (We will choose Algorithm II-3 in class)
- Deal with the Drichlet boundary condition by using Algorithm 111.
- Solve  $A\vec{X} = \vec{b}$  for  $\vec{X}$  by using a direct or iterative method.

### Algorithm

### Recall Algorithm I-3:

- Initialize the matrix:  $A = sparse(N_b, N_b)$ ;
- Compute the integrals and assemble them into A:

```
 \begin{split} \textit{FOR } & n = 1, \cdots, N \text{:} \\ & \textit{FOR } \alpha = 1, \cdots, N_{lb} \text{:} \\ & \textit{FOR } \beta = 1, \cdots, N_{lb} \text{:} \\ & \textit{Compute } r = \int_{E_n} c \frac{\partial^{r+s} \psi_{n\alpha}}{\partial x^r \partial y^s} \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} \ dxdy; \\ & \textit{Add } r \ \text{to } A(T_b(\beta, n), T_b(\alpha, n)). \\ & \textit{END} \\ & \textit{END} \\ & \textit{END} \end{split}
```

# Algorithm

### Recall

• First, we call Algorithm I-3 with r = p = 1 and s = q = 0 to obtain A1.

Dirichlet boundary condition

- Second, we call Algorithm I-3 with r = p = 0 and s = q = 1 to obtain A2.
- Then the stiffness matrix A = A1 + A2.

FE Method

### Algorithm

### Recall Algorithm II-3:

- Initialize the matrix:  $b = sparse(N_b, 1)$ ;
- Compute the integrals and assemble them into b:

```
FOR \ n = 1, \cdots, N:
       FOR \beta = 1, \cdots, N_{lb}:
               Compute r = \int_{F_n} f \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} dx dy;
                b(T_b(\beta, n), 1) = b(T_b(\beta, n), 1) + r
        END
```

**END** 

• Recall: We call Algorithm I-3 with p = q = 0 to obtain b.

Weak/Galerkin formulation

### Recall Algorithm III:

• Deal with the Dirichlet boundary conditions:

```
FOR \ k = 1, \cdots, nbn:
    If boundarynodes(1, k) shows Dirichlet condition, then
         i = boundary nodes(2, k);
         A(i,:) = 0:
         A(i, i) = 1;
         b(i) = g(P_b(:, i));
    ENDIF
END
```

More Discussion

### Measurements for errors

### Recall

Definition ( $L^2$  space)

$$L^2(\Omega) = \{v : \Omega \to \mathbf{R} : \int_{\Omega} v^2 \, dx dy < \infty\}.$$

Dirichlet boundary condition

Definition ( $H^1$  space)

$$H^{1}(\Omega) = \{ v \in L^{2}(\Omega) : \frac{\partial^{\alpha_{1} + \alpha_{2}} v}{\partial x^{\alpha_{1}} \partial v^{\alpha_{2}}} \in L^{2}(\Omega), \ \forall \alpha_{1} + \alpha_{2} = 1 \}.$$

Definition ( $L^{\infty}$  space)

$$L^{\infty}(\Omega) = \{ v : \Omega \to \mathbf{R} : \sup_{(x,y) \in \Omega} |u(x,y)| < \infty \}.$$

- $L^{\infty}$  norm:  $\|u\|_{\infty} = \sup_{(x,y)\in\Omega} |u(x,y)|$  for  $u\in L^{\infty}(\Omega)$ .
- $L^{\infty}$  norm error:  $\|u-u_h\|_{\infty} = \sup_{(x,y)\in\Omega} |u(x,y)-u_h(x,y)|.$
- $L^2$  norm:  $||u||_0 = \sqrt{\int_{\Omega} u^2 dx dy}$  for  $u \in L^2(\Omega)$ .
- $L^2$  norm error:  $\|u-u_h\|_0 = \sqrt{\int_\Omega (u-u_h)^2 dx dy}$ .
- $H^1$  semi-norm:  $|u|_1 = \sqrt{\int_\Omega \left(\frac{\partial u}{\partial x}\right)^2 dx dy} + \int_\Omega \left(\frac{\partial u}{\partial y}\right)^2 dx dy$  for  $u \in H^1(\Omega)$ .
- $H^1$  semi-norm error:  $|u u_h|_1 = \sqrt{\int_{\Omega} \left(\frac{\partial (u u_h)}{\partial x}\right)^2 dx dy} + \int_{\Omega} \left(\frac{\partial (u u_h)}{\partial y}\right)^2 dx dy.$

Weak/Galerkin formulation

• By using  $u_h = \sum_{i=1}^{N_b} u_i \phi_i$ , the definition of  $T_b$ , and the definition of the local basis functions  $\psi_{nk}$ , we get

Dirichlet boundary condition

$$\begin{aligned} \|u - u_h\|_{\infty} &= \sup_{(x,y) \in \Omega} |u(x,y) - u_h(x,y)| \\ &= \max_{1 \le n \le N} \max_{(x,y) \in E_n} |u(x,y) - u_h(x,y)| \\ &= \max_{1 \le n \le N} \max_{(x,y) \in E_n} \left| u(x,y) - \sum_{j=1}^{N_b} u_j \phi_j \right| \\ &= \max_{1 \le n \le N} \max_{(x,y) \in E_n} \left| u(x,y) - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \psi_{nk}(x,y) \right|. \end{aligned}$$

Define

$$w_n(x,y) = \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \psi_{nk}(x,y).$$

Then

$$||u - u_h||_{\infty} = \max_{1 \le n \le N} \max_{(x,y) \in E_n} |u(x,y) - w_n(x,y)|.$$

•  $\max_{(x,y)\in E_n} |u(x,y)-w_n(x,y)|$  can be approximated by choosing the maximum values of  $|u(x,y)-w_n(x,y)|$  on a group of chosen points in  $E_n$ , such as some Gauss quadrature nodes in this element. We denote the approximation by  $r_n$ .

### Algorithm IV:

- Initialize the error error = 0;
- Approximate the maximum absolute errors on all elements and then choose the largest one as the final approximation:

```
FOR n = 1, \dots, N:
     Compute r_n \approx \max_{(x,y) \in E_n} |u(x,y) - w_n(x,y)|;
     IF r_n > error, THEN
           error = r_n;
     END
END
```

• By using  $u_h = \sum_{i=1}^{N_b} u_i \phi_i$ , the definition of  $T_b$ , and the definition of the local basis functions  $\psi_{nk}$ , we get

$$||u - u_{h}||_{0} = \sqrt{\int_{\Omega} (u - u_{h})^{2} dx dy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_{n}} (u - u_{h})^{2} dx dy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_{n}} \left( u - \sum_{j=1}^{N_{b}} u_{j} \phi_{j} \right)^{2} dx dy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_{n}} \left( u - \sum_{k=1}^{N_{lb}} u_{T_{b}(k,n)} \psi_{nk} \right)^{2} dx dy}.$$

Define

$$w_n = \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \psi_{nk}.$$

Dirichlet boundary condition

Then

$$\|u-u_h\|_0 = \sqrt{\sum_{n=1}^N \int_{E_n} (u-w_n)^2 dx dy}.$$

• Each integral  $\int_{F_n} (u - w_n)^2 dx dy$  can be computed by numerical integration.

• By using  $u_h = \sum_{i=1}^{N_b} u_i \phi_i$ , the definition of  $T_b$ , and the definition of the local basis functions  $\psi_{nk}$ , we get

$$|u - u_{h}|_{1,x} = \sqrt{\int_{\Omega} \left(\frac{\partial(u - u_{h})}{\partial x}\right)^{2}}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_{n}} \left(\frac{\partial(u - u_{h})}{\partial x}\right)^{2} dxdy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_{n}} \left(\frac{\partial u}{\partial x} - \sum_{j=1}^{N_{b}} u_{j} \frac{\partial \phi_{j}}{\partial x}\right)^{2} dxdy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_{n}} \left(\frac{\partial u}{\partial x} - \sum_{k=1}^{N_{lb}} u_{T_{b}(k,n)} \frac{\partial \psi_{nk}}{\partial x}\right)^{2} dxdy}.$$

FE Method

### Measurements for errors

Similarly,

$$|u - u_h|_{1,y} = \sqrt{\int_{\Omega} \left(\frac{\partial (u - u_h)}{\partial y}\right)^2 dx dy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_n} \left(\frac{\partial (u - u_h)}{\partial y}\right)^2 dx dy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_n} \left(\frac{\partial u}{\partial y} - \sum_{j=1}^{N_b} u_j \frac{\partial \phi_j}{\partial y}\right)^2 dx dy}$$

$$= \sqrt{\left(\frac{\partial u}{\partial y} - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial \psi_{nk}}{\partial y}\right)^2 dx dy}.$$

Then

$$|u - u_h|_{1}^{2}$$

$$= |u - u_h|_{1,x}^{2} + |u - u_h|_{1,y}^{2}$$

$$= \sum_{n=1}^{N} \int_{E_n} \left( \frac{\partial u}{\partial x} - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial \psi_{nk}}{\partial x} \right)^{2} dxdy$$

$$+ \sum_{n=1}^{N} \int_{E_n} \left( \frac{\partial u}{\partial y} - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial \psi_{nk}}{\partial y} \right)^{2} dxdy.$$

Define

$$w_{n1} = \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial \psi_{nk}}{\partial x},$$

$$w_{n2} = \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial \psi_{nk}}{\partial y}.$$

Then

$$= \sqrt{\sum_{n=1}^{N} \int_{E_n} \left(\frac{\partial u}{\partial x} - w_{n1}\right)^2 dx dy} + \sum_{n=1}^{N} \int_{E_n} \left(\frac{\partial u}{\partial y} - w_{n2}\right)^2 dx dy.$$

• Each integral  $\int_{E_n} \left( \frac{\partial u}{\partial x} - w_{n1} \right)^2 dxdy$  or  $\int_{E_n} \left( \frac{\partial u}{\partial y} - w_{n2} \right)^2 dxdy$  can be computed by numerical integration.

#### Measurements for errors

• Develop a subroutine for a more general formulation

$$\sqrt{\sum_{n=1}^{N} \int_{E_n} \left( \frac{\partial^{\alpha_1 + \alpha_2} u}{\partial x^{\alpha_1} \partial y^{\alpha_2}} - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial^{\alpha_1 + \alpha_2} \psi_{nk}}{\partial x^{\alpha_1} \partial y^{\alpha_2}} \right)^2 dx dy}.$$

- $\|u u_h\|_0$  is equivalent to calling this subroutine with  $\alpha_1 = 0$  and  $\alpha_2 = 0$ .
- $|u u_h|_{1,x}$  is equivalent to calling this subroutine with  $\alpha_1 = 1$  and  $\alpha_2 = 0$ .
- $|u u_h|_{1,y}$  is equivalent to calling this subroutine with  $\alpha_1 = 0$  and  $\alpha_2 = 1$ .

#### Measurements for errors

#### Algorithm V:

- Initialize the error error = 0; input the parameters  $\alpha_1$  and  $\alpha_2$ ;
- Compute the integrals and add them into the total error:

FOR 
$$n = 1, \dots, N$$
:

$$error = error + \int_{E_n} \left( \frac{\partial^{\alpha_1 + \alpha_2} u}{\partial x^{\alpha_1} \partial y^{\alpha_2}} - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial^{\alpha_1 + \alpha_2} \psi_{nk}}{\partial x^{\alpha_1} \partial y^{\alpha_2}} \right)^2 dx dy;$$

$$END$$
  $error = \sqrt{error}$ ;

#### Numerical example

• Example 1: Use the finite element method to solve the following equation on the domain  $\Omega = [-1, 1] \times [-1, 1]$ :

$$-\nabla \cdot (\nabla u) = -y(1-y)(1-x-\frac{x^2}{2})e^{x+y}$$

$$-x(1-\frac{x}{2})(-3y-y^2)e^{x+y},$$

$$u = -1.5y(1-y)e^{-1+y} \text{ on } x = -1,$$

$$u = 0.5y(1-y)e^{1+y} \text{ on } x = 1,$$

$$u = -2x(1-\frac{x}{2})e^{x-1} \text{ on } y = -1,$$

$$u = 0 \text{ on } y = 1.$$

• The analytic solution of this problem is  $u = xy(1 - \frac{x}{2})(1 - y)e^{x+y}$ , which can be used to compute the error of the numerical solution.

FE Method

- More Discussion

Consider

$$-\nabla \cdot (c\nabla u) = f$$
 in  $\Omega$ ,  $\nabla u \cdot \vec{n} = p$  on  $\partial \Omega$ .

Recall

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy - \int_{\partial \Omega} (c \nabla u \cdot \vec{n}) \, v \, ds = \int_{\Omega} f v \, dx dy.$$

Hence

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy = \int_{\Omega} f v \, dx dy + \int_{\partial \Omega} c p v \, ds.$$

- Is there anything wrong? The solution is not unique!
- If u is a solution, then u + c is also a solution where c is a constant.

Consider

$$-\nabla \cdot (c\nabla u) = f \text{ in } \Omega,$$
  
 
$$\nabla u \cdot \vec{n} = p \text{ on } \Gamma_1 \subset \partial \Omega,$$
  
 
$$u = g \text{ on } \partial \Omega / \Gamma_1.$$

Dirichlet boundary condition

Recall

$$\int_{\Omega} c \nabla u \cdot \nabla v \ dx dy - \int_{\partial \Omega} \left( c \nabla u \cdot \vec{n} \right) v \ ds = \int_{\Omega} f v \ dx dy.$$

• Since the solution on  $\partial \Omega/\Gamma_1$  is given by u=g, then we can choose the test function v(x) such that v=0 on  $\partial\Omega/\Gamma_1$ .

Since

$$\int_{\partial\Omega} (c\nabla u \cdot \vec{n}) v \ ds = \int_{\Gamma_1} (c\nabla u \cdot \vec{n}) v \ ds + \int_{\partial\Omega/\Gamma_1} (c\nabla u \cdot \vec{n}) v \ ds$$
$$= \int_{\Gamma_1} cpv \ ds,$$

then

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy - \int_{\Gamma_1} c p v \, ds = \int_{\Omega} f v \, dx dy.$$

Hence the weak formulation is

$$\int_{\Omega} c \nabla u \cdot \nabla v \ dxdy = \int_{\Omega} fv \ dxdy + \int_{\Gamma_1} cpv \ ds.$$

• Then the Galerkin formulation is to find  $u_h \in U_h$  such that

Dirichlet boundary condition

$$\int_{\Omega} c \nabla u_h \cdot \nabla v_h \, dxdy = \int_{\Omega} f v_h \, dxdy + \int_{\Gamma_1} c p v_h \, ds$$

for any  $v_h \in U_h$ .

• Recall: Since  $u_h \in U_h = span\{\phi_i\}_{i=1}^{N_b}$ , then

$$u_h = \sum_{j=1}^{N_b} u_j \phi_j$$

for some coefficients  $u_i$   $(j = 1, \dots, N_b)$ .

• Recall: Choose  $v_h = \phi_i$   $(i = 1, \dots, N_h)$ .

• Then for  $i = 1, \dots, N_b$ , the finite element formulation gives

$$\begin{split} &\int_{\Omega} c \nabla (\sum_{j=1}^{N_b} u_j \phi_j) \cdot \nabla \phi_i \ dx dy = \int_{\Omega} f \phi_i \ dx dy + \int_{\Gamma_1} c p \phi_i \ ds, \\ \Rightarrow & \sum_{i=1}^{N_b} u_j \left[ \int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \ dx dy \right] = \int_{\Omega} f \phi_i \ dx dy + \int_{\Gamma_1} c p \phi_i \ ds. \end{split}$$

#### Recall

Define the stiffness matrix

$$A = [a_{ij}]_{i,j=1}^{N_b} = \left[ \int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \, dx dy \right]_{i,j=1}^{N_b}.$$

Dirichlet boundary condition

Define the load vector

$$\vec{b} = [b_i]_{i=1}^{N_b} = \left[\int_{\Omega} f \phi_i \, dx dy\right]_{i=1}^{N_b}.$$

Define the unknown vector

$$\vec{X} = [u_j]_{j=1}^{N_b}.$$

# • Define the additional vector from the Neumann boundary condition

$$\vec{v} = [v_i]_{i=1}^{N_b} = \left[ \int_{\Gamma_1} cp\phi_i \ ds \right]_{i=1}^{N_b}.$$

- Define the new vector  $\tilde{\vec{b}} = \vec{b} + \vec{v}$ .
- Then we obtain the linear algebraic system

$$A\vec{X} = \widetilde{\vec{b}}.$$

- Code?
- Add one more subroutine for  $\vec{v}$  to the existing code!

#### Recall

- Matrix boundaryedges:
- boundaryedges(1, k) is the type of the  $k^{th}$  boundary edge  $e_k$ : Dirichlet (-1), Neumann (-2), Robin (-3).....
- boundaryedges(2, k) is the index of the element which contains the  $k^{th}$  boundary edge  $e_k$ .
- Each boundary edge has two end nodes. We index them as the first and the second counterclock wise along the boundary.
- boundaryedges(3, k) is the global node index of the first end node of the  $k^{th}$  boundary boundary edge  $e_k$ .
- boundaryedges(4, k) is the global node index of the second end node of the  $k^{th}$  boundary boundary edge  $e_k$ .
- Set nbe = size(boundaryedges, 2) to be the number of boundary edges; 4 D > 4 D > 4 B > 4 B > B

Weak/Galerkin formulation

• The idea for the assembly of the vector  $\vec{v}$  is similar to that of the load vector. We have

Dirichlet boundary condition

$$v_i = \int_{\Gamma_1} cp\phi_i \ ds = \sum_{\substack{e_k \subset \Gamma_1 \\ 1 < k < nbe}} \int_{e_k} cp\phi_i \ ds, \ i = 1, \cdots, N_b.$$

- Loop over all the boundary edges;
- Compute all non-zero local integrals on each Neumann boundary edge for the vector  $\vec{v}$ ;
- Assemble these non-zero local integrals into the corresponding entries of the vector  $\vec{v}$ .

Compute all non-zero local integrals on each Neumann boundary edge for  $\vec{v}$ :

- The index of the element which contains the  $k^{th}$  boundary edge  $e_k$  is  $n_k = boundaryedges(2, k)$ . Then on  $e_k$ , we get non-zero local integrals only when the test basis functions are corresponding to the finite element nodes of the  $n_{\nu}^{th}$  element  $E_{n_{\iota}}$ .
- Let  $p_s = T_h(s, n_k)$   $(s = 1, \dots, N_{lh})$ .
- Then we only consider the test basis functions to be  $\phi_{p_s}$   $(s=1,\cdots,N_{lb})$ .
- There are only  $N_{lh}$  non-zero local integrals on  $e_k$  with the global basis functions  $\phi_{p_s}$  ( $s=1,\cdots,N_{lb}$ ):

$$\int_{P_{l}} cp\phi_{i} ds (i = p_{1}, \cdots, p_{N_{lb}}).$$

In fact, we have

$$\psi_{n_k s} = \phi_{p_s}|_{E_{n_k}} \ (s = 1, \cdots, N_{lb}).$$

Dirichlet boundary condition

 That is, instead of the original non-zero local integrals with the global basis functions  $\phi_{p_s}$   $(s=1,\cdots,N_{lb})$ , we will compute the following non-zero local integrals with the local basis functions  $\psi_{n_{l}s}$   $(s = 1, \dots, N_{lb})$ :

$$\int_{e_k} cp\psi_{n_k\beta} ds \ (eta=1,\cdots,N_{lb}).$$

- Question: how to compute these integrals?
- Gauss quadrature. The needed information is stored in the matrices P and boundaryedges.

Weak/Galerkin formulation

• P(:, boundaryedges(3:4, k)) provides the coordinates of the two end points of the  $k^{th}$  boundary edge. We discuss three cases based on these coordinates.

Dirichlet boundary condition

• Case 1: If a boundary edge is vertical, then it can be described as x = c ( $y_1 \le y \le y_2$ ). The y-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss quadrature on  $[y_1, y_2]$ . And the x-coordinates of the Gauss quadrature nodes are fixed to be c.

Weak/Galerkin formulation

#### Neumann boundary condition

- Case 2: If a boundary edge is horizontal, then it can be described as y = c ( $x_1 \le x \le x_2$ ). The x-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss quadrature on  $[x_1, x_2]$ . And the y-coordinates of the Gauss quadrature nodes are fixed to be c.
- Case 3: Otherwise, a boundary edge can be described as y = ax + b ( $x_1 \le x \le x_2$ ). The x-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss nodes in  $[x_1, x_2]$ . And the y-coordinates of the Gauss quadrature nodes are obtained from y = ax + b.
- The case 3 with a = 0 and b = c is equivalent to case 2. Hence case 2 and case 3 can be combined into one case.

Assemble the non-zero local integrals into  $\vec{v}$ :

- When the test function is  $\phi_i$ , the corresponding non-zero local integrals should be assembled to  $v_i$ .
- Therefore, if we find the global node indices of the test basis functions, we can easily locate where to assemble a non-zero local integral.
- Question: Since we compute

$$\int_{e_k} c p \psi_{n_k \beta} \; ds \; (eta = 1, \cdots, N_{lb})$$

instead of

$$\int_{\rho_b} c \rho \phi_i \ ds \ (i = \rho_1, \cdots, \rho_{N_{lb}}),$$

how do we obtain the corresponding global node indices of the local test basis functions  $\psi_{n_{\nu}\beta}$  ( $\beta=1,\cdots,N_{lb}$ )?

Information matrix T<sub>h</sub>!

• Recall that  $T_b(\beta, n_k)$  give the global node indices of the local test basis functions  $\psi_{n_k\beta}$   $(\beta = 1, \dots, N_{lb})$ .

Dirichlet boundary condition

• That is,

$$\int_{e_k} cp\psi_{n_keta} \; ds \; (eta=1,\cdots,N_{lb})$$

should be assembled to  $v_i$  where  $i = T_b(\beta, n_k)$ .

#### Algorithm VI-1:

- Initialize the vector:  $v = sparse(N_b, 1)$ ;
- Compute the integrals and assemble them into v:

```
FOR \ k = 1, \cdots, nbe:
     IF boundaryedges (1, k) shows Neumann boundary
condition, THEN
           n_k = boundaryedges(2, k);
           FOR \beta = 1, \dots, N_{lb}:
                Compute r = \int_{e_i} cp\psi_{n_k\beta} ds;
                v(T_b(\beta, n_k), 1) = v(T_b(\beta, n_k), 1) + r
           END
     ENDIF
END
```

 If we follow Algorithm VI-1 to develop a subroutine to assemble the vector arising from

$$\int_{e_k} \tilde{p} \frac{\partial^{a+b} \psi_{n_k \beta}}{\partial x^a \partial y^b} \ ds,$$

Dirichlet boundary condition

then Algorithm VI-1 is equivalent to calling this subroutine with parameters: a = b = 0 and  $\tilde{p} = cp$ .

#### Algorithm VI:

- Initialize the vector:  $v = sparse(N_b, 1)$ ;
- Compute the integrals and assemble them into v:

```
FOR k = 1, \dots, nbe:
      IF boundaryedges (1, k) shows Neumann boundary
condition. THEN
             n_k = boundaryedges(2, k);
             FOR \beta = 1, \dots, N_{lb}:
                   Compute r = \int_{e_k} \tilde{p} \frac{\partial^{a+b} \psi_{n_k \beta}}{\partial x^a \partial v^b} ds;
                   v(T_b(\beta, n_k), 1) = v(T_b(\beta, n_k), 1) + r:
             END
      ENDIF
END
```

#### Recall

- Matrix boundarynodes:
- boundarynodes (1, k) is the type of the  $k^{th}$  boundary finite element node: Dirichlet (-1), Neumann (-2), Robin (-3).....
- The intersection nodes of Dirichlet boundary condition and other boundary conditions usually need to be treated as Dirichlet boundary nodes.
- boundarynodes(2, k) is the global node index of the  $k^{th}$  boundary boundary finite element node.
- Set nbn = size(boundarynodes, 2) to be the number of boundary finite element nodes;

Weak/Galerkin formulation

• Example 2: Use the finite element method to solve the following equation on the domain  $\Omega = [-1, 1] \times [-1, 1]$ :

$$-\nabla \cdot (\nabla u) = -2e^{x+y}, 
 u = e^{-1+y} \text{ on } x = -1, 
 u = e^{1+y} \text{ on } x = 1, 
 \nabla u \cdot \vec{n} = -e^{x-1} \text{ on } y = -1, 
 u = e^{x+1} \text{ on } y = 1.$$

Dirichlet boundary condition

• The analytic solution of this problem is  $u = e^{x+y}$ , which can be used to compute the error of the numerical solution.

- Let's code for the linear and quadratic finite element method of the 2D second order elliptic equation with Neumann boundary condition!
- Open your Matlab!

1/128	$2.8155 \times 10^{-8}$	$9.5686 \times 10^{-9}$	$1.1667 \times 10^{-5}$

Table: The numerical errors for quadratic finite element.

- Any Observation?
- Third order convergence  $O(h^3)$  in  $L^2/L^\infty$  norm and second order convergence  $O(h^2)$  in  $H^1$  semi-norm, which match the optimal approximation capability expected from piecewise quadratic functions.

Consider

Weak/Galerkin formulation

$$\begin{aligned} &-\nabla\cdot(c\nabla u)=f & \text{ in } \Omega,\\ &\nabla u\cdot\vec{n}+ru=q & \text{ on } \Gamma_2\subseteq\partial\Omega,\\ &u=g & \text{ on } \partial\Omega/\Gamma_2. \end{aligned}$$

Recall

$$\int_{\Omega} c \nabla u \cdot \nabla v \ dx dy - \int_{\partial \Omega} \left( c \nabla u \cdot \vec{n} \right) v \ ds = \int_{\Omega} f v \ dx dy.$$

• Since the solution on  $\partial \Omega/\Gamma_2$  is given by u=g, then we can choose the test function v(x) such that v=0 on  $\partial\Omega/\Gamma_2$ .

Since

$$\int_{\partial\Omega} (c\nabla u \cdot \vec{n}) v \, ds = \int_{\Gamma_2} (c\nabla u \cdot \vec{n}) v \, ds + \int_{\partial\Omega/\Gamma_2} (c\nabla u \cdot \vec{n}) v \, ds$$
$$= \int_{\Gamma_2} c(q - ru) v \, ds$$
$$= \int_{\Gamma_2} cqv \, ds - \int_{\Gamma_2} cruv \, ds,$$

then

$$\int_{\Omega} c \nabla u \cdot \nabla v \, \, dx dy - \left( \int_{\Gamma_2} cqv \, \, ds - \int_{\Gamma_2} cruv \, \, ds \right) = \int_{\Omega} fv \, \, dx dy$$

Hence the weak formulation is

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy + \int_{\Gamma_2} cruv \, ds = \int_{\Omega} fv \, dx dy + \int_{\Gamma_2} cqv \, ds.$$

• Then the Galerkin formulation is to find  $u_h \in U_h$  such that

$$\int_{\Omega} c \nabla u_h \cdot \nabla v_h \ dx dy + \int_{\Gamma_2} cru_h v_h \ ds = \int_{\Omega} fv_h \ dx dy + \int_{\Gamma_2} cqv_h \ ds$$

for any  $v_h \in U_h$ .

• Recall: Since  $u_h \in U_h = span\{\phi_i\}_{i=1}^{N_b}$ , then

$$u_h = \sum_{j=1}^{N_b} u_j \phi_j$$

for some coefficients  $u_i$   $(j = 1, \dots, N_b)$ .

• Recall: Choose  $v_h = \phi_i$   $(i = 1, \dots, N_h)$ .

• Then for  $i = 1, \dots, N_b$ , the finite element formulation gives

$$\int_{\Omega} c \nabla \left( \sum_{j=1}^{N_b} u_j \phi_j \right) \cdot \nabla \phi_i \, dx dy + \int_{\Gamma_2} cr \left( \sum_{j=1}^{N_b} u_j \phi_j \right) \phi_i \, ds$$

$$= \int_{\Omega} f \phi_i \, dx dy + \int_{\Gamma_2} cq \phi_i \, ds,$$

$$\Rightarrow \sum_{j=1}^{N_b} u_j \left[ \int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \, dx dy \right] + \sum_{j=1}^{N_b} u_j \left[ \int_{\Gamma_2} cr \phi_j \phi_i \, ds \right]$$

$$= \int_{\Omega} f \phi_i \, dx dy + \int_{\Gamma_2} cq \phi_i \, ds.$$

Recall: Define the stiffness matrix

$$A = [a_{ij}]_{i,j=1}^{N_b} = \left[ \int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \, dx dy \right]_{i,j=1}^{N_b}.$$

Recall: Define the load vector

$$\vec{b} = [b_i]_{i=1}^{N_b} = \left[\int_{\Omega} f \phi_i \, dx dy\right]_{i=1}^{N_b}.$$

Recall: Define the unknown vector

$$\vec{X} = [u_j]_{i=1}^{N_b}.$$

Define the additional vector from the Robin boundary condition

$$\vec{w} = [w_i]_{i=1}^{N_b} = \left[ \int_{\Gamma_2} cq\phi_i \ ds \right]_{i=1}^{N_b}.$$

FE Method

## Robin boundary condition

Define the additional matrix from the Robin boundary condition

$$R = [r_{ij}]_{i,j=1}^{N_b} = \left[ \int_{\Gamma_2} cr \phi_j \phi_i \ ds \right]_{i,j=1}^{N_b}.$$

- Define the new vector  $\tilde{\vec{b}} = \vec{b} + \vec{w}$ .
- Define the new matrix  $\widetilde{A} = A + R$ .
- Then we obtain the linear algebraic system

$$\widetilde{A}\vec{X} = \widetilde{\vec{b}}.$$

- Code?
- Add one more subroutine for  $\vec{w}$  and R to the existing code!

#### Recall

Weak/Galerkin formulation

- Matrix boundaryedges:
- boundaryedges(1, k) is the type of the  $k^{th}$  boundary edge  $e_k$ : Dirichlet (-1), Neumann (-2), Robin (-3).....
- boundaryedges(2, k) is the index of the element which contains the  $k^{th}$  boundary edge  $e_k$ .
- Each boundary edge has two end nodes. We index them as the first and the second counterclock wise along the boundary.
- boundaryedges(3, k) is the global node index of the first end node of the  $k^{th}$  boundary boundary edge  $e_k$ .
- boundaryedges(4, k) is the global node index of the second end node of the  $k^{th}$  boundary boundary edge  $e_k$ .
- Set nbe = size(boundaryedges, 2) to be the number of boundary edges; 4 D > 4 M > 4 B > 4 B > B

• The idea for the assembly of the matrix R and the vector  $\vec{w}$  is similar to that of the stiffness matrix and the load vector. We have

$$w_{i} = \int_{\Gamma_{2}} cq\phi_{i} ds = \sum_{\substack{e_{k} \subset \Gamma_{2} \\ 1 \leq k \leq nbe}} \int_{e_{k}} cq\phi_{i} ds, i = 1, \cdots, N_{b},$$

$$r_{ij} = \int_{\Gamma_{2}} cr\phi_{j}\phi_{i} ds = \sum_{\substack{e_{k} \subset \Gamma_{2} \\ 1 \leq k \leq nbe}} \int_{e_{k}} cr\phi_{j}\phi_{i} ds, i, j = 1, \cdots, N_{b}.$$

- Loop over all the boundary edges;
- Compute all non-zero local integrals on each Robin boundary edge for the vector  $\vec{w}$  and the matrix R;
- Assemble these non-zero local integrals into the corresponding entries of the vector  $\vec{w}$  and the matrix R.

Weak/Galerkin formulation

## Robin boundary condition

Compute all non-zero local integrals on each Robin boundary edge for the vector  $\vec{w}$  and the matrix R:

Dirichlet boundary condition

- The index of the element which contains the  $k^{th}$  boundary edge  $e_k$  is  $n_k = boundaryedges(2, k)$ . Then on  $e_k$ , we get non-zero local integrals only when the test and trial basis functions are corresponding to the finite element nodes of the  $n_k^{th}$  element  $E_{n_k}$ .
- Let  $p_s = T_b(s, n) \ (s = 1, \dots, N_{lb}).$
- Then we only consider the test basis functions to be  $\phi_{p_s}$   $(s=1,\cdots,N_{lb})$ .

• There are only  $N_{lb}$  non-zero local integrals on  $e_k$  with the global basis functions  $\phi_{p_s}$  ( $s=1,\cdots,N_{lb}$ ):

Dirichlet boundary condition

$$\int_{e_k} cq\phi_i \; ds, \; i=p_1,\cdots,p_{N_{lb}},$$
  $\int_{e_k} cr\phi_j\phi_i \; ds, \; i,j=p_1,\cdots,p_{N_{lb}}.$ 

In fact, we have

$$\psi_{n_k s} = \phi_{p_s}|_{E_{n_k}} \ (s = 1, \cdots, N_{lb}).$$

 That is, instead of the original non-zero local integrals with the global basis functions  $\phi_{p_s}$   $(s=1,\cdots,N_{lb})$ , we will compute the following non-zero local integrals with the local basis functions  $\psi_{n_b s}$   $(s = 1, \dots, N_{lb})$ :

Dirichlet boundary condition

$$\int_{e_k} c p \psi_{n_k eta} \; ds, \; eta = 1, \cdots, N_{lb},$$
  $\int_{e_k} c r \psi_{n_k eta} \psi_{n_k lpha} \; ds, \; lpha, eta = 1, \cdots, N_{lb}.$ 

- Question: how to compute these integrals?
- Gauss quadrature. The needed information is stored in the matrices P and boundaryedges.

#### Recall

• P(:, boundaryedges(3:4, k)) provides the coordinates of the two end points of the  $k^{th}$  boundary edge. We discuss three cases based on these coordinates.

Dirichlet boundary condition

• Case 1: If a boundary edge is vertical, then it can be described as x = c ( $y_1 \le y \le y_2$ ). The y-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss quadrature on  $[y_1, y_2]$ . And the x-coordinates of the Gauss guadrature nodes are fixed to be c.

- Case 2: If a boundary edge is horizontal, then it can be described as y=c ( $x_1 \le x \le x_2$ ). The x-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss quadrature on  $[x_1, x_2]$ . And the y-coordinates of the Gauss quadrature nodes are fixed to be c.
- Case 3: Otherwise, a boundary edge can be described as y = ax + b ( $x_1 \le x \le x_2$ ). The x-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss nodes in  $[x_1, x_2]$ . And the y-coordinates of the Gauss quadrature nodes are obtained from y = ax + b.
- The case 3 with a = 0 and b = c is equivalent to case 2. Hence case 2 and case 3 can be combined into one case.

Assemble the non-zero local integrals into  $\vec{w}$  and R:

- When the test function is  $\phi_i$ , the corresponding non-zero local integrals should be assembled to  $w_i$ .
- When the trial function is  $\phi_i$  and the test function is  $\phi_j$ , the corresponding non-zero local integrals should be assembled to  $r_{ij}$ .
- Therefore, if we find the global node indices of the trial and test basis functions, we can easily locate where to assemble a non-zero local integral.

More Discussion

Question: Since we compute

$$\int_{e_k} cq\psi_{n_keta} \; ds \; (eta=1,\cdots,N_{lb})$$

Dirichlet boundary condition

instead of

$$\int_{P_b} cq\phi_i \ ds \ (i=p_1,\cdots,p_{N_{lb}}),$$

how do we obtain the corresponding global node indices of the local test basis functions  $\psi_{n_k\beta}$  ( $\beta=1,\cdots,N_{lb}$ )?

Question: Since we compute

$$\int_{e_{k}} cr\psi_{n_{k}\beta}\psi_{n_{k}\alpha} ds (\alpha, \beta = 1, \cdots, N_{lb})$$

Dirichlet boundary condition

instead of

$$\int_{e_L} cr\phi_j \phi_i \ ds \ (i,j=p_1,\cdots,p_{N_{lb}}),$$

how do we obtain the corresponding global node indices of the local trial and test basis functions  $\psi_{n_{\mu}\alpha}$  and  $\psi_{n_b\beta}$   $(\alpha,\beta=1,\cdots,N_{lb})$ ?

Information matrix T<sub>h</sub>!

- Recall that  $T_b(\alpha, n_k)$  and  $T_b(\beta, n_k)$  give the global node indices of the local trial and test basis functions  $\psi_{n_k\alpha}$  and  $\psi_{n_k\beta}$   $(\alpha, \beta = 1, \cdots, N_{lb})$ .
- That is,

Weak/Galerkin formulation

$$\int_{e_k} cq\psi_{n_k\beta} \ ds \ (\beta=1,\cdots,N_{lb})$$

Dirichlet boundary condition

should be assembled to  $w_i$  where  $i = T_b(\beta, n_k)$ .

And

$$\int_{\theta_{l}} cr \psi_{n_{k}\alpha} \psi_{n_{k}\beta} ds (\alpha, \beta = 1, \cdots, N_{lb})$$

should be assembled to  $r_{ij}$  where  $i = T_b(\beta, n_k)$  and  $j = T_b(\alpha, n_k)$ .

# Algorithm VII-1:

FND

```
• Initialize R = sparse(N_b, N_b) and w = sparse(N_b, 1);

    Compute the integrals and assemble them into R and w:

   FOR k = 1, \dots, nbe:
         IF boundaryedges (1, k) shows Robin boundary condition, THEN
               n_k = boundaryedges(2, k);
               FOR \beta = 1, \cdots, N_{lb}:
                     Compute r = \int_{e_i} cq \psi_{n_k \beta} ds;
                     w(T_b(\beta, n_k), 1) = w(T_b(\beta, n_k), 1) + r;
               END
               FOR \alpha = 1, \cdots, N_{lb}:
                     FOR \beta = 1, \dots, N_{lb}:
                          Compute r = \int_{e_{k}} cr \psi_{n_{k}\beta} \psi_{n_{k}\alpha} ds;
                           Add r to R(T_b(\beta, n_k), T_b(\alpha, n_k));
                     FND
               FND
         ENDIF
```

#### Algorithm VII-2:

**END** 

- Initialize  $R = sparse(N_b, N_b)$  and  $w = sparse(N_b, 1)$ ;
- ullet Compute the integrals and assemble them into R and w:

```
FOR k = 1, \dots, nbe:
      IF boundaryedges (1, k) shows Robin boundary condition, THEN
            n_k = boundaryedges(2, k);
            FOR \beta = 1, \cdots, N_{lb}:
                  Compute r = \int_{\mathbf{e}_{l}} cq \psi_{n_{k}\beta} ds;
                  w(T_b(\beta, n_k), 1) = w(T_b(\beta, n_k), 1) + r;
                  FOR \alpha = 1, \dots, N_{lb}:
                         Compute r = \int_{e_{k}} cr \psi_{n_{k}\beta} \psi_{n_{k}\alpha} ds;
                         Add r to R(T_b(\beta, n_k), T_b(\alpha, n_k));
                  FND
            END
      ENDIF
```

• If we follow Algorithm VII-1 to develop a subroutine to assemble the vector arising from

$$\int_{e_k} \tilde{p} \frac{\partial^{a+b} \psi_{n_k \beta}}{\partial x^a \partial y^b} \ ds,$$

and the vector arising from

$$\int_{e_k} \tilde{r} \frac{\partial^{m+s} \psi_{n_k \alpha}}{\partial x^m \partial y^s} \frac{\partial^{d+l} \psi_{n_k \beta}}{\partial x^d \partial y^l} \ ds,$$

then Algorithm VII-1 is equivalent to calling this subroutine with parameters: a = b = r = s = d = l = 0,  $\tilde{p} = cq$ , and  $\tilde{r} = cr$ .

 Note that the vector part is exactly the same as what we had for the Neumann boundary condition!

FE Method

### Robin boundary condition

```
Algorithm VII:
```

- Initialize  $R = sparse(N_b, N_b)$  and  $w = sparse(N_b, 1)$ ;
- Compute the integrals and assemble them into R and w:

```
FOR k = 1, \dots, nbe:
      IF boundaryedges (1, k) shows Robin boundary condition, THEN
              n_k = boundaryedges(2, k);
              FOR \beta = 1, \cdots, N_{lb}:
                    Compute r = \int_{e_L} \tilde{p} \frac{\partial^{a+b} \psi_{n_k \beta}}{\partial v^a \partial v^b} ds;
                     w(T_b(\beta, n_k), 1) = w(T_b(\beta, n_k), 1) + r;
              END
              FOR \ \alpha = 1, \cdots, N_{lb}:
                     FOR \beta = 1, \cdots, N_{lb}:
                           Compute r = \int_{e_{k}} cr \psi_{n_{k}\beta} \psi_{n_{k}\alpha} ds;
                            Add r to R(T_b(\beta, n_k), T_b(\alpha, n_k));
                     FND
              FND
```

**FNDIF** 

#### Recall

- Matrix boundarynodes:
- boundarynodes(1, k) is the type of the  $k^{th}$  boundary finite element node: Dirichlet (-1), Neumann (-2), Robin (-3).....
- The intersection nodes of Dirichlet boundary condition and other boundary conditions usually need to be treated as Dirichlet boundary nodes.
- boundarynodes(2, k) is the global node index of the  $k^{th}$ boundary boundary finite element node.
- Set nbn = size(boundarynodes, 2) to be the number of boundary finite element nodes;

• Example 3: Use the finite element method to solve the following equation on the domain  $\Omega = [-1, 1] \times [-1, 1]$ :

$$-\nabla \cdot (\nabla u) = -2e^{x+y},$$

$$u = e^{-1+y} \text{ on } x = -1,$$

$$u = e^{1+y} \text{ on } x = 1,$$

$$\nabla u \cdot \vec{n} + u = 0 \text{ on } y = -1,$$

$$u = e^{x+1} \text{ on } y = 1.$$

• The analytic solution of this problem is  $u = e^{x+y}$ , which can be used to compute the error of the numerical solution.

- Let's code for the linear and quadratic finite element method of the 2D second order elliptic equation with Neumann boundary condition!
- Open your Matlab!

h	$\ u-u_h\ _{\infty}$	$\ u-u_h\ _0$	$ u-u_h _1$
1/8	$1.3358 \times 10^{-2}$	$5.1094 \times 10^{-3}$	$1.8523 \times 10^{-1}$
1/16	$3.4487 \times 10^{-3}$	$1.2760 \times 10^{-3}$	$9.2559 \times 10^{-2}$

Table: The numerical errors for quadratic finite element.

- Any Observation?
- Third order convergence  $iO(h^3)$  in  $L^2/L^\infty$  norm and second order convergence  $O(h^2)$  in  $H^1$  semi-norm, which match the optimal approximation capability expected from piecewise quadratic functions.

# Dirichlet/Neumann/Robin mixed boundary condition

Consider

$$\begin{split} -\nabla \cdot (c\nabla u) &= f \quad \text{in } \Omega, \\ \nabla u \cdot \vec{n} &= p \quad \text{on } \Gamma_1 \subset \partial \Omega, \\ \nabla u \cdot \vec{n} + ru &= q \quad \text{on } \Gamma_2 \subseteq \partial \Omega, \\ u &= g \quad \text{on } \partial \Omega / (\Gamma_1 \cup \Gamma_2). \end{split}$$

Recall

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy - \int_{\partial \Omega} (c \nabla u \cdot \vec{n}) \, v \, ds = \int_{\Omega} f v \, dx dy.$$

• Since the solution on  $\partial\Omega/(\Gamma_1\cup\Gamma_2)$  is given by u=g, then we can choose the test function v(x) such that v=0 on  $\partial\Omega/(\Gamma_1\cup\Gamma_2)$ .

# Dirichlet/Neumann/Robin mixed boundary condition

Hence

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy + \int_{\Gamma_2} cruv \, ds$$

$$= \int_{\Omega} fv \, dx dy + \int_{\Gamma_1} cpv \, ds + \int_{\Gamma_2} cqv \, ds.$$

Dirichlet boundary condition

- Code?
- Combine all of the subroutines for Dirichlet/Neumann/Robin boundary conditions.

# Non-isotropic equation

Consider

$$\begin{split} &-\nabla\cdot (c\nabla u)=f \ \text{ in } \Omega,\\ &c\nabla u\cdot \vec{n}=p \ \text{ on } \Gamma_1\subset\partial\Omega,\\ &c\nabla u\cdot \vec{n}+ru=q \ \text{ on } \Gamma_2\subseteq\partial\Omega,\\ &u=g \ \text{ on } \partial\Omega/(\Gamma_1\cup\Gamma_2), \end{split}$$

where

$$c = \left(\begin{array}{cc} c_{11} & c_{12} \\ c_{21} & c_{22} \end{array}\right).$$

Recall

$$\int_{\Omega} c \nabla u \cdot \nabla v \ dx dy - \int_{\partial \Omega} \left( c \nabla u \cdot \vec{n} \right) v \ ds = \int_{\Omega} fv \ dx dy.$$

### Non-isotropic equation

- Since the solution on  $\partial\Omega/(\Gamma_1\cup\Gamma_2)$  is given by u=g, then we can choose the test function v(x) such that v=0 on  $\partial\Omega/(\Gamma_1\cup\Gamma_2)$ .
- Hence

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy + \int_{\Gamma_2} ruv \, ds$$

$$= \int_{\Omega} fv \, dx dy + \int_{\Gamma_1} pv \, ds + \int_{\Gamma_2} qv \, ds.$$

where

$$c\nabla u \cdot \nabla v = \begin{pmatrix} c_{11} & c_{12} \\ c_{21} & c_{22} \end{pmatrix} \begin{pmatrix} u_{x} \\ u_{y} \end{pmatrix} \cdot \begin{pmatrix} v_{x} \\ v_{y} \end{pmatrix}$$

$$= \begin{pmatrix} c_{11}u_{x} + c_{12}u_{y} \\ c_{21}u_{x} + c_{22}u_{y} \end{pmatrix} \cdot \begin{pmatrix} v_{x} \\ v_{y} \end{pmatrix}$$

$$= c_{11}u_{x}v_{x} + c_{12}u_{y}v_{x} + c_{21}u_{x}v_{y} + c_{22}u_{y}v_{y}.$$

- Code? Just call Algorithm I-3 four times! Everything else is the same as before!
- Call Algorithm I-3 with r=1, s=0, p=1, q=0, and  $c=c_{11}$  to obtain  $A_1$ ;
- Call Algorithm I-3 with r=0, s=1, p=1, q=0, and  $c=c_{11}$  to obtain  $A_2$ ;
- Call Algorithm I-3 with r=1, s=0, p=0, q=1, and  $c=c_{21}$  to obtain  $A_3$ ;
- Call Algorithm I-3 with r = 0, s = 1, p = 0, q = 1, and  $c = c_{22}$  to obtain  $A_4$ .
- Then the stiffness matrix is  $A = A_1 + A_2 + A_3 + A_4$ .

# A more general second order equation

Consider

$$\begin{split} &-\nabla\cdot (c\nabla u) + au = f &\text{ in } \Omega,\\ &c\nabla u\cdot \vec{n} = p &\text{ on } \Gamma_1 \subset \partial\Omega,\\ &c\nabla u\cdot \vec{n} + ru = q &\text{ on } \Gamma_2 \subseteq \partial\Omega,\\ &u = g &\text{ on } \partial\Omega/(\Gamma_1 \cup \Gamma_2), \end{split}$$

where

$$c = \begin{pmatrix} c_{11} & c_{12} \\ c_{21} & c_{22} \end{pmatrix}.$$

Then

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dxdy - \int_{\Omega} (c \nabla u \cdot \vec{n}) \, v \, ds + \int_{\Omega} auv \, dxdy = \int_{\Omega} fv \, dxdy.$$

- Since the solution on  $\partial\Omega/(\Gamma_1\cup\Gamma_2)$  is given by u=g, then we can choose the test function v(x) such that v=0 on  $\partial\Omega/(\Gamma_1\cup\Gamma_2)$ .
- Hence

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dxdy + \int_{\Omega} auv \, dxdy + \int_{\Gamma_2} ruv \, ds$$

$$= \int_{\Omega} fv \, dxdy + \int_{\Gamma_1} pv \, ds + \int_{\Gamma_2} qv \, ds.$$

where

$$c\nabla u \cdot \nabla v = c_{11}u_xv_x + c_{12}u_yv_x + c_{21}u_xv_y + c_{22}u_yv_y.$$

- Code? Just call Algorithm I-3 five times! Everything else is the same as before!
- Call Algorithm I-3 with r = 0, s = 0, p = 0, q = 0, and c = a to obtain  $A_0$ ;
- Call Algorithm I-3 with r=1, s=0, p=1, q=0, and  $c=c_{11}$  to obtain  $A_1$ ;
- Call Algorithm I-3 with r=0, s=1, p=1, q=0, and  $c=c_{11}$  to obtain  $A_2$ ;
- Call Algorithm I-3 with r=1, s=0, p=0, q=1, and  $c=c_{21}$  to obtain  $A_3$ ;
- Call Algorithm I-3 with r=0, s=1, p=0, q=1, and  $c=c_{22}$  to obtain  $A_4$ .
- Then the stiffness matrix is  $A = A_0 + A_1 + A_2 + A_3 + A_4$ .

## Linear regression for the convergence order

- Consider  $||u u_h|| = Ch^r$ .
- The goal is to design a linear regression to obtain the C and r based on the h and errors given in the table.
- First.

$$log(||u - u_h||) = log(Ch^r)$$

$$= log(C) + log(h^r)$$

$$= log(C) + r log(h).$$

- Let  $y = log(||u u_h||), x = log(h), a = r, b = log(C).$
- Then y = ax + b.
- For different h, we can obtain the corresponding x and y.
- Then by the regular linear regression, we can obtain a and b, which give us the  $C = e^b$  and r = a.
